

Money Printing and Inspection

The process of printing money requires thorough inspection and must be inspected in a series of stages.

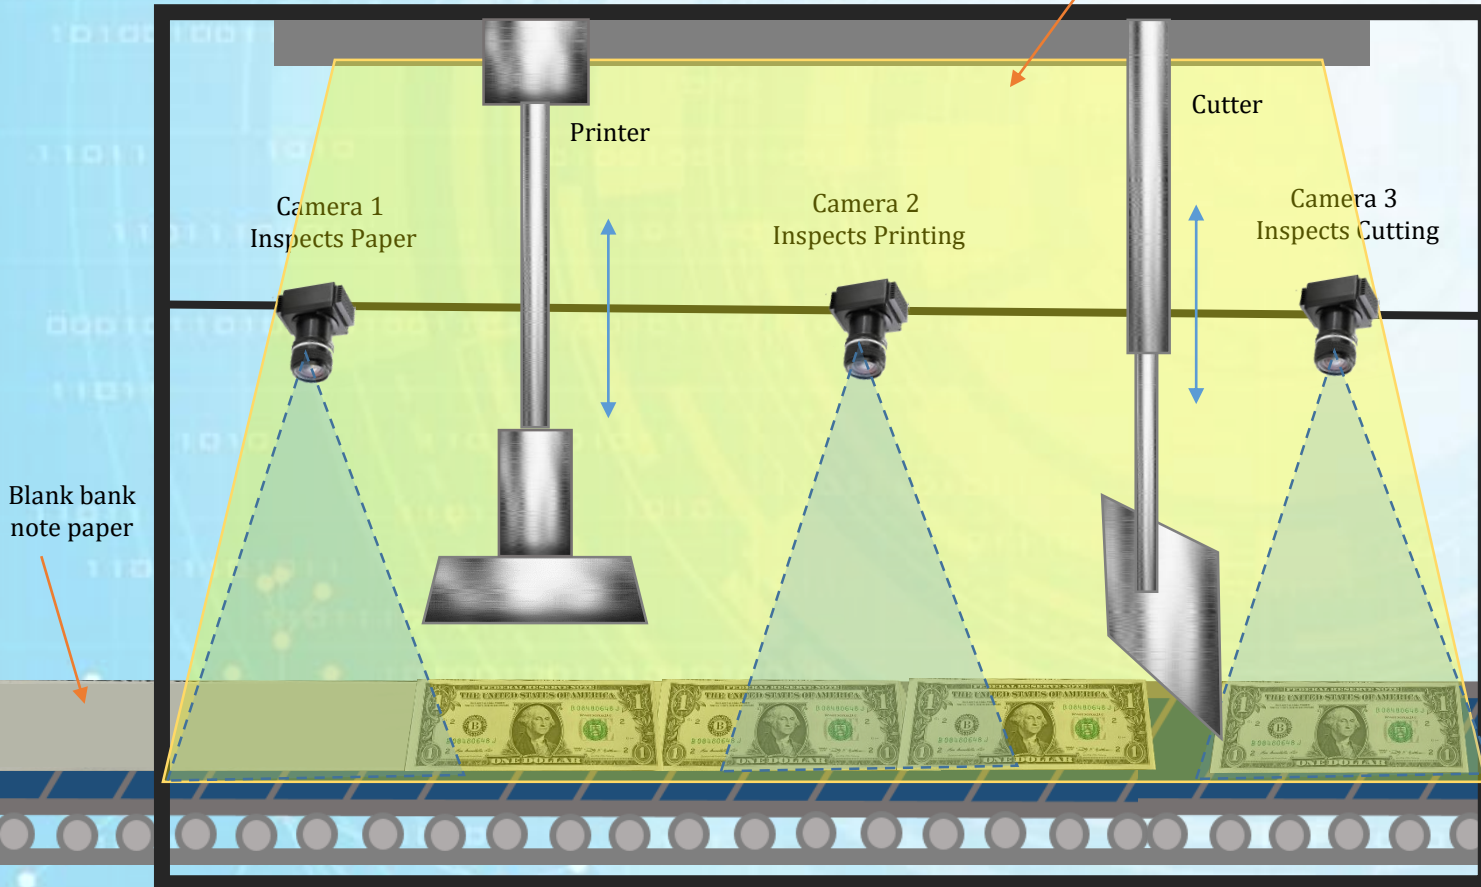

Solution:

Three large format, high speed TDI, CameraLink cameras are incorporated into the money printing system. Each camera inspects a different stage of the printing process.

The first camera inspects the blank bank note paper as it enters the printing machine. The second camera inspects the money after it has been printed. The third camera inspects the money after it has been cut. The cameras are able to inspect the money at a high rate of accuracy and precision.

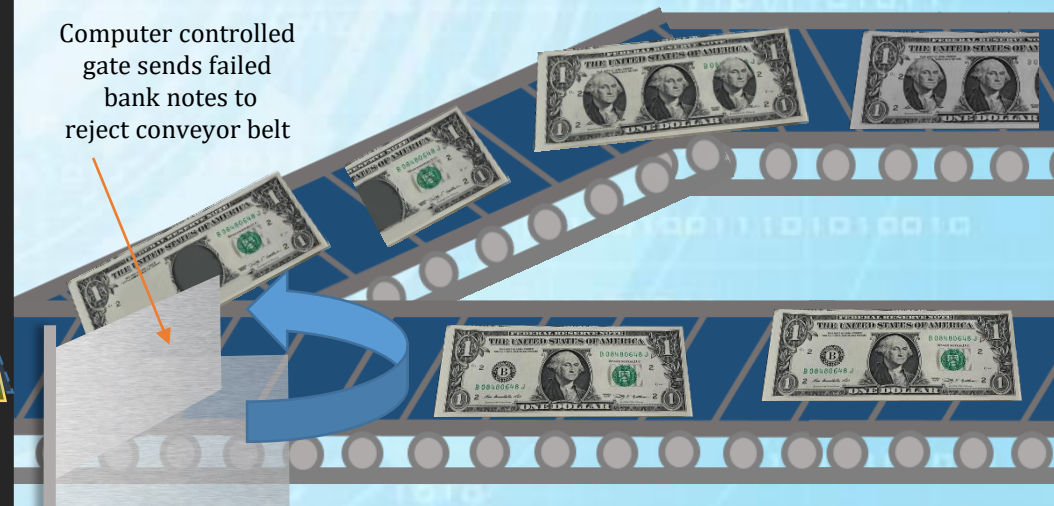

Controlled by large computer system
